REMARKS

Applicant respectfully requests reconsideration and allowance of the application and all pending claims in view of the above-amendments and the following remarks.

I. <u>SPECIFICATION</u>

A. Title

The title of the invention was objected to as being not descriptive.

With this Amendment, the title is amended to include further limitations from claim 1 and is now sufficiently descriptive.

If the objection to the title is maintained, Applicant respectfully requests a more detailed explanation as to how the title is not descriptive or a suggestion as how the title can be further improved.

B. Abstract

Applicants enclose a "replacement" abstract in which the legal phraseology has been removed, as suggested in the Office Action.

C. Specification Section Headings

The specification was objected to as not following the sections identified in 37 C.F.R. §1.77(b) in order.

The section headings listed in §1.77(b) are suggested, but not required. In any case, the Preliminary Amendment filed with the application added all relevant sections and in the order specified in §1.77(b). Further, additional section headings are added with the present amendment.

Finally, Applicant submits a substitute specification in which the appropriate section headings can be seen more clearly.

Applicants respectfully request that the specification be replaced with the enclosed, clean "substitute specification". No new matter has been added. Applicants also enclose an annotated version that illustrates the marked changes from the immediate prior version, as amended with the Preliminary Amendment filed December 15, 2005.

With these amendments, Applicants request that the objections to the specification be withdrawn.

II. DOUBLE PATENTING

Claims 1, 3-6, 8-10, 13-17, 19-22 are rejected on the ground of nons-tatutory obviousness-type double patenting as being allegedly unpatentable over claims 1, 2, 4-10, 147, 15, 17, 19, 20-23 of copending Application No. 10/561,114.

Enclosed is a terminal disclaimer, which overcomes the provisional rejection based on non-statutory double patenting.

III. Claim Rejections Under 35 U.S.C. §103

Claims 1, 3-22 are rejected under 35 U.S.C. 103(a) as being allegedly unpatentable over Andy Stanford-Clark, <u>Integrating Monitoring and Telemetry Devices as Part of Enterprise Information Resources</u>, Websphere MQ Development, IBM software Group, pp. 1-13 (March 2002) (hereinafter "IBM Document"), in view of Petite, U.S. Patent No. 7,103,511.

A. **IBM document**

1.1 Summary of the document

The IBM document concerns a general protocol for an MQ Integrator SCADA device (usually named MQIsdp) developed by the IBM Software Group. It deals with notions of "publish" and "subscribe", and illustrates some examples of application.

1.2 Relevance of the Document

In accordance with the Examiner's opinion, the IBM document discloses (using the terms of claim 1):

System for remote control of equipment (« a system that manages the flow of information from remote devices to any enterprise applications that need the data », p.3, l.1-3, « telemetry integration applications », p.9, l.8) enabling interconnection between at least one server (« broker ») and at least one remote equipment (« client ») using the MQIsdp protocol (« this allows remote devices to connect to the broker using the MQIsdp protocol », p.9, l.2-3), said system associating, with at least one of the said remote equipment, radiocommunication means (« the devices communicate with the Arcom Director unit using 20-mile line-of-sight, spread-spectrum wireless links from Data-Linc Goup », p.12, l.3-4, « communicating through Very Small Aperture Terminal (VSAT) satellite links », p.13, l.3)

1.2.1 Differences of the Document Relative to Claim 1

Regarding claim 1, and contrary to the Examiner's opinion, the IBM document does not disclose:

- radiocommunication means capable of sending and receiving AT type commands sent by and / or to be sent to an external application used by the said remote equipment;
- radiocommunication means endowed with a set of special AT commands for exchanging data with at least one server using the said MQIsdp protocol, so as to enable an interconnection between the said server(s) and the said remote equipment through the said radiocommunication means, without requiring knowledge of the said MQIsdp protocol in the said remote equipment;
- at least a first mode, radiocommunication means only managing signaling of a data exchange, the said data being transferred directly from remote equipment to a server, or vice versa.

Contrary to the Examiner's opinion, the notion of AT commands is not at all suggested in the IBM document. Moreover, there is nothing in the IBM document that discloses or suggests the using of a set of specific AT commands, enabling an external application to manage the data exchanges between a remote terminal and a broker without the external application knowing the MQIsdp protocol.

As a consequence and contrary to the Examiner's opinion, the IBM document is not relevant toward the invention as defined by independent claim 1 of the present patent application.

B. **PETITE document (U.S. Pat. No.7 103 511 B2)**

2.1 Summary of the document

The PETITE document deals with wireless communications networks for remote controlling and monitoring wireless devices. More particularly, this document concerns an automatic control system for controlling remote equipment implemented via a host computer which is connected to a wide area network 120 (WAN) and comprising a plurality of wireless transceiver devices 125. Each transceiver device 125 has a unique identifier and means of:

- receiving a sensor data signal from one of remote devices;
- transmitting an original data message using a predefined wireless communication protocol comprising the corresponding unique identifier of device 125 and sensor data signal.

One of the plurality of transceiver devices 125 is in charge of sending the whole original data messages to a site controller 150, connected to the WAN 120, which is configured to manage communications between wireless communications networks (remote equipment) and the host computer connected to the WAN 120.

2.2 Relevance of the document

Even though the PETITE document relates to a system for monitoring and/or controlling a plurality of remote devices, there is nothing in PETITE that discloses or suggests features of claim 1, namely (using the terms of claim 1):

- the fact that the system for remote control of apparatuses enables the interconnection between at least one broker and at least one remote apparatus according to the MQIsdp protocol;
- the fact that the system associates radiocommunication means capable of internally processing a communication protocol implementing API-type source functions available in a software platform (Open AT) enabling at least one application to be embedded;
- the fact that said radiocommunication means are provided with a set of specific (API) functions enabling data to be exchanged with at least one server implementing said MQIsdp protocol, so as to enable an interconnection between said broker(s) and said remote apparatus(es) via said radiocommunication means, with the latter also managing at least one application between said broker(s) and said remote apparatus(es).
- the fact that, at least a first mode, said radiocommunication means only managing signaling of a data exchange, the said data being transferred directly from remote equipment to a server, or vice versa.

As a consequence, the PETITE document is not relevant toward the invention as defined by independent claim 1 of the present patent application.

C. Non-relevance of the combination of the IBM and PETITE documents

Neither the IBM document nor the PETITE document is relevant towards the invention as claimed by independent claim 1.

With neither the IBM document nor the PETITE document providing the features of claim 1, the combination of the PETITE and IBM documents does not disclose or suggest the features of the present invention as recited in independent claim 1.

As a consequence, the invention recited in claim 1 in dependent claims 3-18 (at least because these claims depend from claim 1) would not have been obvious to a person of ordinary skill in the art at the time the invention was made.

IV. <u>SUMMARY</u>

The foregoing remarks are intended to assist the Office in examining the application and in the course of explanation may employ shortened or more specific or variant descriptions of some of the claim language. Such descriptions are not intended to limit the scope of the claims; the actual claim language should be considered in each case.

-12-

Furthermore, the remarks are not to be considered exhaustive of the facets of the invention

which are rendered patentable, being only examples of certain advantageous features and

differences, which Applicants' attorney chooses to mention at this time. For the foregoing

reasons, Applicants reserve the right to submit additional evidence showing the distinction

between Applicants' invention to be unobvious in view of the prior art.

Furthermore, in commenting on the references and in order to facilitate a better

understanding of the differences that are expressed in the claims, certain details of distinction

between the same and the present invention have been mentioned, even though such

differences do not appear in all of the claims. It is not intended by mentioning any such

unclaimed distinctions to create any implied limitations in the claims.

The Director is authorized to charge any fee deficiency required by this paper or

credit any overpayment to Deposit Account No. 23-1123.

Respectfully submitted,

WESTMAN, CHAMPLIN & KELLY, P.A.

SYSTEM AND METHOD FOR REMOTE CONTROLLING OF EQUIPMENT

ENABLING INTERCONNECTION BETWEEN A SERVER AND REMOTE

EQUIPMENT IN ACORDANCE WITH THE MQIsdp PROTOCOL WITH THE AID

OF AT COMMANDS, AND CORRESPONDING DEVICE,

RADIOCOMMUNICATION MODULE, AND SET OF COMMANDS

CROSS-REFERENCE TO RELATED APPLICATION

This Application is a Section 371 National Stage Application of International Application No. PCT/FR2004/001499, filed June 16, 2004 and published as WO 2004/114625 A2 on December 29, 2004, not in English.

STATEMENT REGARDING FEDERALLY SPONSORED RESEARCH OR DEVELOPMENT

None.

5

15

THE NAMES OF PARTIES TO A JOINT RESEARCH AGREEMENT None.

FIELD OF THE DISCLOSURE

The domain of the disclosure is remote control of equipment, and particularly equipment with limited data processing resources. Thus, the disclosure is applicable for example to remote data recording systems, for example on water, gas or electricity meters, and more generally to telemetry, order monitoring and more generally Machine to Machine (M to M) systems.

BACKGROUND OF THE DISCLOSURE

Many solutions already exist for performing such operations. They have generally been developed specifically for a given application. In other words, they are "proprietary" solutions that are difficult to adapt to other applications.

10

15

25

There is also a protocol developed by the IBM and ARCOM Control Systems companies (registered trademarks), known as the "MQIsdp Messaging" technology. This technique proposes a communication protocol between one or several items of equipment with limited resources, and one or several servers, using a TCP/IP link.

However, even with this specific protocol, special processing means (microprocessors, memories, etc.) have to be added to the equipment so as to set up a dialog with these remote servers, depending on the required MQIsdp format. The connection between the equipment and the server may use a telephone type link using a modem.

However, in many applications, it would be desirable to be able to manage without a wire telephone link. In this case, radiocommunication means could be envisaged, for example according to the GSM or GPRS standard.

In this case, radiotelephone equipment would be used to perform the modem function. However, according to prior art, it is necessary to associate special and proprietary data processing means with the equipment to set up and exchange data with the server.

This aspect is a very important limitation to the development of the applications mentioned above, and to many other applications with which the MQIsdp protocol could be used.

20 SUMMARY

One particular aspect of an embodiment of the invention is to overcome this disadvantage with prior art.

It should be noted that the fact that this problem has been identified is itself part of an embodiment of the invention. At least some of those skilled in the art are convinced that it is absolutely necessary to equip terminal equipment with sufficient processing means, and will never consider reducing or eliminating these processing means.

10

15

20

25

However, one aspect of an embodiment of the invention is to simplify the processing in the equipment, and to avoid the need for this equipment to have complex and expensive means such as a microprocessor.

Another aspect of an embodiment the invention is to propose a simple and generic technique to easily and efficiently set up a dialog with a server using the MQIsdp protocol.

Yet another aspect of an embodiment of the invention is to provide such a technique for setting up a connection between servers and equipment by radiotelephone link in a simple, standardised and inexpensive manner.

Another aspect of an embodiment of the invention is to provide such a technique to develop a large number of applications, without it being necessary to develop specific applications each time.

Another aspect of an embodiment of the invention is to provide such a technique in which there is no need to know the MQIsdp protocol in the developed applications.

Yet another aspect of an embodiment of the invention is to provide such a technique that is technically simple and upgradeable and adaptable to various situations (for example the amount of data to be exchanged) and to any future changes that are made.

These aspects and others that will appear more clearly in the following, are achieved using a system for remote control of equipment enabling interconnection between at least one broker and at least one remote equipment using the MQIsdp protocol.

According to an embodiment of the invention, radiocommunication means capable of sending and receiving AT type commands sent by and / or sent to an external application used by the said remote equipment are associated with at least one of the said remote equipment, the said radiocommunication means being provided with a set of special AT commands for exchanging data with at least one broker using the said MQIsdp protocol, so as to enable an interconnection between the said server(s) and the

15

20

25

said remote equipment through the said radiocommunication means, without requiring knowledge of the said MQIsdp protocol in the said remote equipment.

Thus, it is easy and simple to manage data exchanges without the need to develop special applications or to associate important means (particularly microprocessor and memory) with a terminal. Neither the terminal nor the application needs to know the MQIsdp protocol. The radiocommunication means manage these aspects. The application only needs to know the new AT commands.

Advantageously, at least in a first mode, the said radiocommunication means only manage signalling of a data exchange, the said data being transferred directly from remote equipment to a server, or vice versa.

Preferably, at least in a second mode, the said radiocommunication means manage signalling of a data exchange and transfer of the said data, the data being temporarily stored in at least one buffer memory.

In this case, the size of the said buffer memory(ies) can advantageously be parameterable.

According to one advantageous embodiment, the said system operates in the said first mode when the size of the said buffer memory(ies) is equal to 0, and otherwise in the said second mode.

Thus, a simple and efficient means is obtained for performing two functions (mode selection and queue sizing) with a single command.

In one advantageous embodiment of the invention, the said radiocommunication means comprise a radiocommunication module comprising all radio frequency and base band processing means on the same substrate, together with means of managing the said AT commands.

In particular, the said radiocommunication means can include the said MQIsdp protocol in the form of an "open-AT" application defining the said set of special AT commands.

Advantageously, the said set of special AT commands includes commands for:
- connecting to one of the said servers;

10

15

20

- sending messages;
- receiving messages.

Preferably, at least some of the said special AT commands are organized so as to be able to perform at least two functions and / or to act on at least two distinct aspects, as a function of a predefined configuration.

This can strongly reduce the number of necessary commands, while performing all necessary operations taking account of any future developments.

Thus in one preferred embodiment, the said set of commands only includes 8 commands.

The said set of special AT commands advantageously includes at least one configuration command used to define communication parameters with one of the said servers.

Preferably, the system uses a single configuration command (+WSPGSET) for configuration of radiocommunication aspects and the general configuration of aspects related to the MQIsdp protocol.

In particular, the said configuration command can be used to select one of at least two transmission modes (GSM or GPRS).

Advantageously, the system uses three configuration commands:

- a general communication configuration command (+WSPGSET);
- a connection configuration command (+WSPCSET), particularly used to specify the coordinates of a server;
- a configuration command for the "will" configuration message (+WSPWMS), particularly to specify the channel to which a message will be sent.

Preferably, it also uses at least one general communication command for sending and / or receiving messages using the MQIsdp protocol.

Thus, five general communication commands can advantageously be used:

- a command for specifying an MQIsdp context (+WSPDCONT);
- a command for managing a connection with a server (+WSPCONM);
- a command for sending a message (+WSPSMSG);

10

15

20

25

- a command for receiving a message (+WSPRMSG);
- an administration command, used to do a reset and / or return to the default values of a set of parameters (+WSPPA).

Advantageously, it also uses at least one query command by an external application, preferably two query commands by an external application, on the following in turn:

- the current state of the connection (+WSPICON);
- reception and / or sending of a message (+WSPIMSG).

An embodiment of invention also relates to the method for remote control of equipment used by a system as described above. It enables interconnection between at least one server and at least one remote equipment according to the MQIsdp protocol by associating at least one of the said remote items with radiocommunication means capable of sending and receiving AT type commands sent by and / or to be sent to an external application used by the said remote equipment, and by using a set of special AT commands in the said radiocommunication means for exchanging data with at least one server using the said MQIsdp protocol. This enables an interconnection between the said server(s) and the said remote equipment through the said radiocommunication means, without requiring additional processing and / or data formatting means in the said remote equipment.

An embodiment of invention also relates to radiocommunication devices and modules comprising radiocommunication means used in such an equipment remote control system.

A further embodiment of the invention relates to sets of AT commands used in an equipment remote control system, used to exchange data with at least one server using the said MQIsdp protocol.

Other special features and advantages of one or more embodiments of the invention will become clearer after reading the following description of a preferred embodiment of the invention, given as a simple illustrative and non-limitative example and appended figures.

BRIEF DESCRIPTION OF THE DRAWINGS

- Figure 1 shows an example of a system in which an embodiment of the invention could be used;
- Figure 2 shows an example of how the MQIsdp protocol can be integrated in an Open-AT application; and
- Figures 3A to 3L show different example embodiments of a connection according to embodiments of the invention.

DETAILED DESCRIPTION OF ILLUSTRATIVE EMBODIMENTS

1. Reminders about the MQIsdp protocol (registered trademark)

10

5

The MQIsdp (WebSphere MQ Integrator SCADA device protocol) is an open standard developed by IBM and Arcom Control Systems (registered trademarks), to enable data exchanges (in the form of messages) from generally inexpensive remote devices (or terminals) with little processing power, to a WebSphere MQ Integrator by TCP/IP server, also called a broker in the following, and vice versa.

15

MQIsdp (also called Wavecom SCADA in the following) is a data (message) transfer protocol based on a publish / subscribe type communication model freely available on Internet. It may be described as being a simple agnostic data management layer above the TCP/IP protocol, for message management and acknowledgements of reception necessary to assure reliable delivery of the message.

20

In the publish / subscribe communication model, data are exchanged between a data producer / consumer (the client) and a message broker (the server). The message broker may be considered as being a multi-protocol switching hub for the application protocol that receives the messages, and it transforms them, reformats them, etc. into other structures as a function of a data model defined by the user.

25

Finally, any transformed messages may be sent (published) by the broker to subscriber clients (zone device, ERP, SAP, Oracle, SQL, etc.) using appropriate client cards. Obviously, the broker can also publish messages that do not originate from a client.

10

15

20

25

The message broker manages all messages input to and output from an item. A client publishes messages in / with an item or subscribes to messages from / by an item identifying the message flow from the message broker to which or from which the message is to be published.

The MQIsdp specification defines a set of very simple messages including "connect", "disconnect", "publish", "subscribe", and "unsubscribe".

2. Principles of an embodiment of the invention

2.1 General

Therefore, one or more embodiments of the invention relate to a new approach for remote control of equipment, particularly based on the use of a set of special AT type commands, enabling an external application to manage data exchanges between a remote terminal and a server, through radiocommunication links (for example a Wismo type (registered trademark) module), without the application knowing the MQIsdp protocol used by the server. This aspect is managed by radiocommunication means, and for example acknowledgements described in the MQIsdp protocol.

Figure 1 is a simplified illustration of the principle of an embodiment of the invention. The objective is to have any type of remote machine, for example measurement instruments 11, communicate with one or several applications hosted on servers 12, capable of receiving data 13 using the MQIsdp protocol, and to transform, process or transmit these data.

According to this embodiment, the remote terminals (or machines) 11 are associated with radiocommunication means 14, for example in the form of a Wismo module (registered trademark) particularly embedding development tools distributed by the applicant under the "Muse platform" trademark).

2.2 Module concept

As a reminder, it should be noted that most radiocommunication devices conventionally comprise a set of electronic components arranged on a printed circuit. These various components are designed to perform the various necessary functions, from reception of a RF signal until generation of an audible signal (in the case of a

10

15

20

25

radiotelephone) and vice versa. Some of these functions are analogue and others are digital.

Manufacturing of these radiocommunication devices is an important subject of research. Three objectives are aimed at, that are difficult to reconcile: miniaturising devices, increasing features and simplifying assembly. It is known that installation of different components on a printed circuit is a relatively complex operation, since many components have to be arranged on a very restricted surface area, due to miniaturization requirements.

Therefore, the design of these systems is complex, since it also requires a combination of various components, often from multiple sources, that have to be made to operate together, respecting the specific features of each. Furthermore, after assembling the set of components, calibration and test phases that are frequently long and complex are necessary to guarantee correct operation of the device.

Finally, despite the reduction in size of some components, the assembly occupies a certain surface area that is difficult to reduce.

The holder of this patent application has proposed a method of overcoming some of these disadvantages, consisting of grouping all or at least some of the functions of a digital radiocommunication device in a single module.

Such a module is in the form of a single compact housing, preferably shielded, that device manufacturers can integrate directly without needing to take account of a multitude of components.

This module (also sometimes called a "macro-component") is actually formed by grouping several components on a substrate, so as to be implanted in the form of a single element. It includes essential components and software necessary for operation of a communication terminal using radio-electrical frequencies. Therefore, there is no longer a set of complex steps for the conceptual design and validation of this terminal. All that is necessary is to reserve the space necessary for the module.

10

15

20

25

Therefore, such a module can be used to easily and quickly integrate all components into wireless terminals in an optimised manner (portable telephones, modems or any other application using a wireless standard).

Furthermore, since this module contains all essential functions and has been designed as a complete unit, calibration and test problems no longer arise in the same manner, or are at least very much simplified.

Thus, modules distributed by the holder of this patent application are fully tested both in terms of hardware and software on most networks on which they could be used later. Furthermore, the module advantageously encompasses industrial proprietary aspects (since all functions have been grouped together, the module manufacturer manages the corresponding patent right aspects) and technical support aspects.

2.3 AT commands

The principle of using AT commands is already known. For example, it is described in patent document FR-99 13645, and in various specifications distributed by the applicant and that can be referred to for further information if necessary.

2.4 New AT commands

This module 14 is capable of managing a small number of simple AT commands, enabling a simple and efficient dialog with an external application associated with a terminal. It makes the transformation to the MQIsdp format and manages sending and receiving of data 15 using this protocol, in a manner transparent for the application.

Thus, the data exchange can be made using radio waves 16, for example according to the GSM or GPRS standard. Seen from the server 12, information is in the MQIsdp format. There is no need for terminals 11 to know this protocol, they only need to know a few AT commands. It is thus easy and inexpensive to implement an external application at low cost in (or adjacent to) a terminal without the need to provide a microprocessor and memories, and a dedicated application.

As will be seen later, the proposed AT commands may be limited to 8, although they can be upgraded.

Two data transfer modes are proposed:

10

25

- data transit through the module 14. These data are temporarily stored in buffers (buffer memories), the size of which can be configured as a function of needs;
- data are transmitted directly between the terminal and the server, without being stored in memory in the module 14, the module 14 only managing all signalling aspects (opening and closing of the connection, acknowledgements, etc.).

The first case could correspond to the most frequent case of small messages, and the second case to the transfer of large files, as is allowed for in the MQIsdp protocol. It is thus possible to manage everything through the module, without adding any external memory and intelligence, while enabling data transfers with a volume greater than the storage capacity of the module.

Advantageously, a single command can be used for sizing of buffers and changing from one mode to the other (the second mode corresponding to a zero value).

Figure 2 shows a simplified example of a software architecture that could be used in the module 14.

Such a module 14 usually comprises:

- a basic software layer 21 (Wavecom Core SoftWare);
- an Open AT library 22;
- an ADL library 23;
- a TCP/IP library 24;
- an application layer 25 (Open AT Application).

According to an embodiment of the invention, a library 26 of special commands (Wavecom SCADA Protocol Library) is provided to communicate using the MQIsdp protocol that is above the TCP/IP library 24.

The AT commands 27 address either the base layer 21, the TCP/IP library 24 or the SCADA library 26 depending on the case.

The proposed interface using AT commands includes only 8 commands in this library 26, capable of fully controlling the MQIsdp protocol and particularly:

- possibility of sizing two internal queues for managing incoming and outgoing messages;

15

20

- possibility of outsourcing management of large messages;
- definition of connection contexts;
- management of configuration parameters;
- management of sending different types of messages by generic command.
- 3. Detailed description of an embodiment of commands

The following describes AT commands that could be used to control the Wavecom SCADA protocol 26.

5 Wavecom core software:

Software layer managing all AT commands so that related GSM events or services can be managed.

3.2.2 Definitions

The terms MS and ME are used for mobile terminals handling GSM services.

The word "product" refers to any Wavecom product (particularly a module) handling the AT commands interface.

Symbols:

15

20

<CR> carriage return character

<LP> line feed character

[...] optional parameter of an AT command

<...> Parameter name between angle brackets. The angle brackets do not appear on the command line.

3.3 AT command syntax

This section defines the format of AT commands, and mechanisms for assignment of default values of their parameters.

3.3.1 Command line

Commands always begin with the standard "AT+WSP" prefix and finish with the <CR> character.

Optional parameters are indicated between square brackets [].

For example: $AT + WSPCmd = \langle Param1 \rangle [,\langle Param2 \rangle]$

In this example, $\langle Param2 \rangle$ is optional. When the AT + WSPCmd command is executed without $\langle Param2 \rangle$, the default value of the $\langle Param2 \rangle$ parameter is used.

3.3.2 Information responses and result codes

Responses begin and end with <CR> <LF> (except for the format of the ATVO DCE response) and ATQ1 commands (deletion of result code) (see the related document [2]).

- . If the command syntax is incorrect, the command is returned to the Wavecom central software for processing. In this case, the Wavecom central software returns the "ERROR" message.
 - . If the command syntax is correct but incorrect parameters have been transmitted, the <CR> <LF> + WSP ERROR: <Err> <CR> <LF> response is returned together with appropriate error codes.
- . If the command line was executed successfully, the <CR> <LF> "OK" <CR> <LF> string is returned.

3.4 Configuration commands

Different parameters are necessary to provide the Wavecom product with all information about the initial connection:

- 15 . The support network used: GSM or GPRS
 - . Timeout parameters
 - . The functional mode of superposition of the Wavecom SCADA protocol
 - . All necessary information about the support network so that a TCP/IP infrastructure can be accessed
 - . The "Will" configuration message for the connection.

3.4.1 +WSPGSET General parameters

a - Description

This command is used to configure all parameters used to select the support network, the different timeouts and the functional mode of the Wavecom SCADA protocol.

3.4.3 Parameters for the Will + WSPWMS message a – Description This command configures all parameters related to the Will message. This command returns +WSP ERROR: 4013 if the value 0 is assigned to the <OutBoxSize> parameter.

b – Syntax

Command	Possible responses
AT + WSPWMS = <topic></topic>	>
[, <qos>[,<retain></retain></qos>	Or
[, <payloadlength>]]]<cr>,</cr></payloadlength>	Error code:
Enter <payloadlength> the number of</payloadlength>	+WSP ERROR:4000
bytes indicated by the <msglength></msglength>	+WSP ERROR:4001
parameter	+WSP ERROR:4002
Or	
Enter< Payload> <ctrl>P <ctrl>C when</ctrl></ctrl>	
the <payloadlength> parameter is not</payloadlength>	
defined	
Note: configures all parameters in the	
Will message.	
AT + WSPWMS?	+WSPWMS: <topic>, <qos>, <retain></retain></qos></topic>
	<cr> <lf> <payload></payload></lf></cr>
Note: returns information from the Will	OK
message	
AT + WSPWMS = ?	+WSPWMS: (maximum length of a
	<pre><topic>, (list of <qos> accepted), (list</qos></topic></pre>
	of <retain> accepted), (range of</retain>
Note: possible values	<payloadlength> accepted)</payloadlength>
	OK

c – *defined values*

<Topic>

This string identifies the information channel

on which text data were published.

Maximum length = 64 characters

<Qos> (0 - 2)

Quality of service

0

Once maximum - <Fire and Forget>

At least once

Delivery with

1

acknowledgement of reception

Exactly once – Delivery guaranteed

Default value = 0

2

<Retain> (0 - 1)

Informs the broker that the message must be retained and sent to any new subscriber to

this item as the initial message.

Default value = 0

<PayloadLength>

Maximum length of the message body. This value is limited by the value of the <OutBoxSize> parameter. If the value 0 is assigned to the <OutBoxSize> parameter, this value is no longer limited (see the +WSPGSET command section for further information about the <OutBoxSize> parameter).

d – Possible error codes

+WSP ERROR 4000	Non-activated function of the Wavecom
	SCADA protocol.
	This error is returned when the function of the
	Wavecom SCADA protocol has not been
	activated in the WISMO module.
+WSP ERROR 4001	Illegal operation. This error is returned when
	an incorrect parameter is detected.
+WSP ERROR 4002	Operation not accepted by the current
	configuration.

3.5 – General commands

5

3.5.1 – Definition of the WSP + WSPDCONT context

a-Description

This command defines parameter values for a WSP context identified by the local context identification parameter <WSPCid>.

A maximum of two WSP contexts can be defined.

A special form of the defined command, +WSPDCONT = <WSPCid>, is used to delete a WSP context.

b – Syntax

Command	Possible responses
	_
$AT + WSPDCONT = \langle WSPCid \rangle [,$	OK
[<clientid>], [broker_Adr>], [<port>],</port></clientid>	+WSP ERROR: 4000

	<cleanstart_flag2>,</cleanstart_flag2>
	<keepalivetimer2>,</keepalivetimer2>
	<uselwt_flag2>,</uselwt_flag2>
Note: lists all created contexts	OK

AT+WSPCONT=?	+WSPCONT: (list of <wspcid></wspcid>
	accepted), (max length of <clientid>,</clientid>
	(max length of <broker_addr>), (range</broker_addr>
	of <port> accepted), (list of</port>
	<cleanstart_flag> accepted), (list of</cleanstart_flag>
	<keepalivetimer> accepted), (list of</keepalivetimer>
	<uselwt_flag> accepted).</uselwt_flag>
Note: possible values	ОК

c – *Defined values* <WSPCid> (1 - 2)WSP context identifier: numeric parameter that indicates a definition of a given WSP context. <Clientid> Client identifier for the Wavecom SCADA protocol: string parameter that identifies the client. Maximum length = 23 characters Default value = unreadable <Broker_Addr> Parameter on string (or IP address) that identifies the broker server and provides a means of reaching it. Maximum length = 255 characters Default value = unreadable <Port> (0 - 65535) Numeric parameter (broker port) used to reach the broker server to transfer data. Default values = 1883<CleanStart_Flag> (0 - 1)The client continues with the previous connection 0 data. 1 The broker cancels all pending messages for the client, deletes all client subscriptions and reassigns

	the value 1 to the message ID.	
	Default value = 0	
<keepalivetimer></keepalivetimer>	Maximum interval between each client message.	
(0-32767)	The value 0 indicates that no connection holding	
	(KeepAlive) timeout processing is made	
	Default value = 0	
<uselwt_flag> (0 - 1)</uselwt_flag>	Indicates if the Will message is used:	
0	The Will message is not used	
1	The Will message is used	
	Default value = 0	

d – *possible error codes*

+WSP ERROR 4000	Non-activated function of the Wavecom SCADA
	protocol. This error is returned when the function of
	the Wavecom SCADA protocol has not been
	activated in the WISMO module.
+WSP ERROR 4001	Illegal operation. This error is returned when an
	incorrect parameter is detected.

3.5.3 – Send message +WSPSMSG

a-Description

5

10

This command sends or obtains the status of several message types, and particularly Publish, Subscribe and Unsubscribe.

The specification of the Wavecom SCADA protocol enables a SUBSCRIBE / UNSUBSCRIBE message to send several subscriptions / unsubscriptions. The limit for this AT command is fixed at one item per SUBSCRIBE / UNSUBSCRIBE message. In this case, an application that wants to subscribe / unsubscribe from several items will send several SUBSCRIBE / UNSUBSCRIBE requests for a single item.

b – Syntax

Command	Possible responses
AT + WSPSMSG = <actiontype></actiontype>	When a message is sent
[, <param1> [,<param2> [,<param3></param3></param2></param1>	+WSPSMSG: <msghandle></msghandle>
[, <param4> [,<param5></param5></param4>	OK
[, <param6>]]]<cr></cr></param6>	Or
	When a message status is requested

	+WSPSMSG: <status></status>
	ОК
	Or
	Error code:
	+WSP ERROR:4000
	+WSP ERROR:4001
	+WSP ERROR:4007
Note: configures all message parameters	+WSP ERROR:40011
AT + WSPSMSG?	OK
Note: no effect	
AT + WSPSMSG = ?	+WSPSMSG: (list of <actiontype></actiontype>
	managed)
Note: possible values	
	ОК

c – Defined values

<ActionType> Operation type

0 Send a message

1 Obtain the message status

* Send a message (5 parameters) – ActionType = 0

Generic	Context parameter	Description	Format	Specifications	Default
parameter					value
<param1></param1>	<msgtype></msgtype>	Message	Numeric	(3,8,10)	NA
		identifier		3 Publish	

				8 Subscribe	
				10 Unsubscribe	
<param2></param2>	<topic></topic>	String	Alphanumeric	Maximum length	**
		indicating	string	64	
		the			
		information			
		channel on			
		which text			
		data are			
		sent			
<param3></param3>	<qos></qos>	Quality of	Numeric	(0 - 2)	0
		Service		0 – Fire and	
				forget	
				1 – Delivery with	
				acknowledgement	
				of reception	
				2 – Delivery	
				guaranteed	
<param4></param4>	<retain></retain>	Notifies the	Numeric	(0 - 1)	0
		broker that			
		the message			
		must be			
		kept and			
		must be			
		sent as the			
		initial			
		message to			
		any new			

		subscriber			
		to this item			
<param5></param5>	<dupflag></dupflag>	Double	Numeric	(0 - 1)	0
		indicating		0 – first send	
		message		1 – duplicated	
		used only if		message	
		OutBoxSize			
		= 0			
<param6></param6>	<payloadlength></payloadlength>	Maximum	Numeric	(*)	0**
		length of			
		the message			
		body			

(*) Maximum length of the message body. This value is limited by the value of the <OutBoxSize> parameter. If the value 0 is assigned to the <OutBoxSize> parameter, there is no limit (see the +WSPGSET command section for further information about the <OutBoxSize> parameter).

Note: if MsgType = 10 (UNSUBSCRIBE), then

only the <Topic> parameter is compulsory.

Else, if MsgType=8 (SUBSCRIBE) then

the <Topic> and <QoS> parameters are used. If the <QoS> parameter is activated, then the default value is used.

Else, if MsgType=3 (PUBLISH) then

all parameters are used. If the <QoS> and <Retain> parameters are omitted, the default values are used.

Then, assign the number of bytes indicated by the <PayLoadLength> parameter to the <Payload> parameter.

15 **O**r

Enter <PayLoad> <Ctrl>P <Ctrl>C when the <PayLoadLength> parameter is omitted.

* Obtain the status (1 parameter) – ActionType = 1

Generic	Context	Description	Format	Specifications	Default
parameter	parameter				value
<param1></param1>	<msghandle></msghandle>	Numeric.	Numeric	(0 - 32767)	NA
		Identifies			
		the			
		message			

5

<Status>

Message status

- W WAITING. The message is queued, the transaction has not begun.
- P PENDING. The message is queued. The transaction is in progress.
- N Message cannot be found. The message is not in the queue. Either the transaction is terminated, or the message was never put in a queue.

d – Possible error codes

+WSP ERROR 4000 Non-activated function of the Wavecom SCADA protocol. This error is returned when the function of the Wavecom SCADA protocol has not been activated in the WISMO module.

+WSP ERROR 4001 Illegal operation. This error is returned when an incorrect parameter is detected.

+WSP ERROR 4007 Client not connected.

+WSP ERROR 40011 Queue saturated

$e-Informative\ examples$

Command	Possible responses
AT + WSPSMSG=0,3. "My Publish	>
Topic",0,0,0	
	Note: waits for the end of the text
Note: publishes a message	identified by <ctrl>P <ctrl>C</ctrl></ctrl>
My body publish message for test	+WSPSMSG:1
<ctrl>P <ctrl>C</ctrl></ctrl>	
	OK
Note: enter the Payload parameter	Note: the message is in the internal
	queue or has been sent (if the internal
	queue is not used)
AT + WSPSMSG = 1,1	+WSPSMSG:W
	OK
Note: obtains the message 1 status	Note: message
AT + WSPSMSG=0,3. "My Publish	+WSP ERROR: 4001
Topic" 0,10,0	
Note: enter the Publish message with an	Note: illegal operation
incorrect <retain> parameter</retain>	
AT + WSPSMSG = 0.8. "My Subscribe	+WSPSMSG:2
Topic"	
	OK

	Note: the message is in the internal
Note: Subscribe message in which the	queue or has been sent (if the internal
default value of the <qos> parameter is</qos>	queue was not used)
used	
AT + WSPSMSG = 0,10, "My	+WSPSMSG:3
Unsubscribe Topic"	
	OK
	Note: the message is in the internal
Note: Unsubscribe message	queue or has been sent (if the internal
	queue was not used)
AT + WSPSMSG?	OK
AT + WSPSMSG=?	+WSPSMSG:(0,1)
Note: possible values	OK

Notes:

- [1] If there is a <Ctrl>P in the text, the <Ctrl>P <Ctrl>P escape command has to be used.
- [2] The <MsgHandle> parameter is only managed if the value 32767 bytes is assigned to the <OutBoxSize> parameter (see the General parameters section, +WSPGSET command).

When the value 0 is assigned to the <OutBoxSize> parameter, the <MsgHandle> parameter is set equal to the value 1 each time.

3.5.4 – Reception of the +WSPRMSG message

10 a - Description

This command is used to read a received message. The message is received with the +WSPIMSG indication.

The broker can send a PUBLISH message to the client on any item to which the client is subscribed. This AT command is used to obtain messages arrived in the InBox queue.

This AT command is only available if the value 0 is not assigned to the <InboxSize> parameter (see general parameters, +WSPGSET command). If the value 0 is assigned to the <InboxSize> parameter, messages are displayed with the +WSPIRMSG indication.

10 b-Syntax

Command	Possible responses
$AT + WSPRMSG = \langle Msgid \rangle [,\langle Mode \rangle]$	+WSPRMSG: <msgid> [,<topic></topic></msgid>
	[, <dup> [,<qos> [,<retain>[,</retain></qos></dup>
	DataLength>]]]]]
	<cr> <lf></lf></cr>
	<data></data>
	ОК
	Or
	Error codes:

Note: perform an action with an	Note: illegal operation			
incorrect <actiontype> parameter</actiontype>				
AT + WSPPA?	OK			
Note: no effect				
AT + WSPPA = ?	+WSPPA: (0 - 1)			
Note: possible values	OK			

3.6 WSP indications

This chapter describes all event responses for sent messages.

3.6.1 +WSPDCONI connection indications

A connection indication mechanism (+WSPCONI) is set up so that the external application can determine the connection status.

These indications are sent when a value between 1 and 3 is assigned to the <NotifyLevel> parameter (see the +WSPGSET command).

Syntax: +WSPCONI: <Status>

10 **Status>**

5

15

- 0 The requested disconnection is terminated
- 1 The connection with the broker is set up
- 2 The connection with the broker is refused
- 3 Protocol version not handled
- 4 Identifier rejected by the broker
- 5 Will message configuration necessary. This indication is returned only when the +WSPWMS command was not configured before the connection.
- 6 Allocated time for configuration of the Will message exceeded. Connection not set up.

3.6.2 +WSPSMSGI message send indications

A (+WSPSMSGI) message indications mechanism is set up so that the external application can determine if the message is received or if a message has been sent.

These indications are sent when the value 2 or 3 is assigned to the <NotifyLevel> parameter (see the +WSPGSET command) and if the value 32767 is assigned to the <InboxSize> parameter.

Syntax: + WSPSMSGI: <Status>,<Msgid> <Status>

- 0 The <Msgid> message has been distributed (QoS>0)
- 1 The <Msgid> message has been deleted (all attempts have failed)

<Msgid>

(0 - 32767) Message identifier

3.6.3 + WSPRMSGI message reception indications

If the Inbox size (<InboxSize>) is zero (0), messages are displayed with the +WSPRMSGI indication as soon as they are received.

These indications are sent when the value 2 or 3 is assigned to the <NotifyLevel> parameter (see +WSPGSET command) and when the value 0 is assigned to the <InboxSize> parameter.

The message header and / or the payload are displayed as a function of the +WSPGSET RecMsgMode parameter.

Syntax: +WSPRMSGI: <Status>[, <Msgid>[, <Topic>, <Dup>, <QoS>, <Retain>, <Length> <CR> <LF>

<Data>]]

<Status>

- 0 <WMsgid> message received in the Inbox
- 1 Message received. The message is sent directly to the output.
- 2 Inbox saturated
- 3 No message reception capacity
- 4 Message terminated
- 5 Incorrect message

<Msgid> (0 - 32767) Received message identifier

<Topic> Message item string

<Dup> (0 - 1) Double indicator (for QoS 1 and 2)

<QoS> (0 - 2) Quality of Service for this message

<Retain> (0 - 1) Memorisation indicator (Retain)

<Length> (0 - Outbox size)

Payload length

<Data> Message data

3.7 Error codes

This chapter describes all error codes returned by WSP AT commands.

Error code	Meaning					
+WSP ERROR: 4000	Non-activated function of the Wavecom SCADA					
	protocol. This error is returned when the function					
	of the Wavecom SCADA protocol has not been					
	activated in the WISMO module.					
+WSP ERROR: 4001	Illegal operation. This error is returned when an					
	incorrect parameter value has been used.					
+WSP ERROR: 4002	Operation not handled by the current					
	configuration.					
+WSP ERROR: 4003	WSP context not defined					
+WSP ERROR: 4004	Client already connected					
+WSP ERROR: 4005	Connection operation pending					
+WSP ERROR: 4006	Disconnection operation pending					
+WSP ERROR: 4007	Client not connected					
+WSP ERROR: 4008	No network					
+WSP ERROR: 4009	No GPRS					
+WSP ERROR: 40010	No TCP/IP					
+WSP ERROR: 40011	Queue saturated					
+WSP ERROR: 40012	Message cannot be found					
+WSP ERROR: 40013	Connection refused by the broker					
+WSP ERROR: 40014	Connection refused due to a protocol version not					

5

10

15

20

	handled					
+WSP ERROR: 40015	Connection	refused:	identifier	rejected	by	the
	broker					

4. Examples

This section gives examples of the use of all AT commands in the Wavecom SCADA protocol described above. These examples are shown in Figures 3A to 3K respectively.

In these figures, the information is presented using a format well known to those skilled in the art, clearly showing data exchanges between the various entities (server or broker, module and external application). The fourth column shows which commands are used, and their meaning when applicable.

It does not seem necessary to add further comments on these figures, those skilled in the art will be capable of interpreting them directly.

The following aspects are presented:

- 4.1 Receiving a message with QoS 0
 - 4.1.1 With an Inbox (Figure 3A)
 - 4.1.2 Without an Inbox (Figure 3B)
- 4.2 Receiving a message with QoS 1
 - 4.2.1 With an Inbox (Figure 3C)
 - 4.2.2 Without an Inbox (Figure 3D)
- 4.3 Receiving a message with QoS 2
 - 4.3.1 With an Inbox (Figure 3E)
 - 4.3.2 Without an Inbox (Figure 3F)
- 4.4 Sending a message with QoS 0
 - 4.4.1 With an Outbox (Figure 3G)
 - 4.4.2 Without an Outbox (Figure 3H)
- 4.5 Sending a message with QoS 1

5

10

15

- 4.5.1 With an Outbox (Figure 3I)
- 4.5.2 Without an Outbox (Figure 3J)
- 4.6 Sending a message with QoS 2
 - 4.6.1 With an Outbox (Figure 3K)
 - 4.6.2 Without an Outbox (Figure 3L)

4.7 Comments

In these various figures, it can be seen that the external application does not need to know the MQISdp protocol (PUBLISH, PUBREC, PUBREL, PUBCOM commands, etc.), all it needs to know are the AT commands described above.

The module makes the interface transparently. Programming of the module to make this interface is obvious, firstly from the specifications given above, and secondly from the specifications for the MQIsdp protocol.

Although the present invention has been described with reference to preferred embodiments, workers skilled in the art will recognize that changes may be made in form and detail without departing from the spirit and scope of the invention.
